

I am concerned that a few Amateurs who for some reason have decide to pick on a very few who operate in a concerned and professional manner and experiment with audio, not necessarily wide band audio, and are now trying to get rule making that is not necessary. SSB signals up to 3Khz,wide if not overly processed, are no problem to other Amateurs and are available to all on stock radios manufactured today. If you are close to another station using 2.4 or 3.0 you will hear them if you have a good antenna system. The answer is not for more written rules but for the angry few to realize that there is room in this hobby for all kinds of experimentation. I STRONGLY oppose any new rule making to restrict bandwidth.
